

Prone Carts

Standard - available with or without Power	
	
FA/STRM	FA/STRP
<p>The standard prone cart is still popular for clients' with long term skin care issues who can't put any pressure on the sacral area. The pronecart allows the client to leave his room and socialize,</p>	<p>The power gurney will allow the quadriplegic to get out of the specialty bed and socialize. We severely limit the speed for safety. The standard configuration is front wheel drive, but the unit can be ordered as a rear wheel drive if desired. We have explored the possibility of mid-wheel drive, but to date haven't had a request.</p>
Range of Motion (R.O.M.) - available with or without Power	
 	
FSTRM	Power Pack FSTRP
<p>The range of motion pronecart was conceived by the VA Minneapolis. There were two goals:</p> <ul style="list-style-type: none"> • Shorten the wheelbase for turns (kneeling position 24" shorter) • Provide a surface for the contracted client who can't straighten to lay prone. 	<p>The ROM is a heavy system with batteries. If the client wants or requires independence the standard, manual propel will make self-propulsion problematic. Specialty electronics are available to limit the range of motion if certain ranges are unsafe, or initiate a tone response.</p>

Did You Know? Prone carts are also called stretchers, gurneys or wheelcarts. The name *gurney* comes from its similarity to a horse-drawn cab patented in the U.S. in 1883 by J. Theodore Gurney. Prone carts are for clients whose diagnosis makes them poor candidates for the more traditional wheel chairs, but who still need the same mobility and adaptive support.

Specialty		
Short	Elevating	RW Drive
		
Call for Information	Call for Information	Call for Information
Many of our prone carts are for a client who will be using it for the rest of his life. If they are a double amputee the shorter length makes the system far more maneuverable.	This unit was developed for a client who needed an elevating platform for level transfer, and who prepared meals at home and needed to be level with counters and stove.	The standard prone carts are available with front or rear wheel drive. Front wheel is the default when no option is specified, or when renting a prone cart. Midwheel has been considered and might provide advantages when trying to operate in a confined space.
Accessories		
Drawer	Side Support	6 Wheel
		
STRT	SDSR	Call for Information
The pull out storage drawer provides a safe place for personal possessions, medical supplies, hydration, etc.	Gel padded side rail that can be positioned where needed. The pads are available in 3.5" by 10", 12" 14" and 16". The side rails do not work well with the manual propel, short gurney.	This adaptation is a necessity if the client is in a standard prone cart and transported in a van/bus and the prone cart is lifted by a platform lift. The interior wheels can be configured to match the footprint of the lift.
B Box		While not a prone cart, the B Box is an admirable adjunctive device. We received a request for a device that would position the wound care/skin flap client's knees and hips at 90/90. It has wheels and can be moved where needed, can be positioned to the desired height, and support extremely large legs on a gel platform.
